Only by impermissible hindsight – supplemented by introduction of acts not taught by either reference – could the arrangements of claims 1-9 be achieved.

Perkowski, which allegedly anticipates claims 10-13, concerns a bar code system permitting a consumer to obtain additional product information in a retail store. However, Perkowski fails to teach the particular application claimed, namely identifying clothing or accessories that complement a particular garment, by reference to multi-bit data decoded from a garment tag.

1. Claim 1

Claim 1 is an independent method claim that concerns electronic ordering from a printed catalog:

*1. An electronic commerce method comprising:  
providing a printed catalog that includes an image of an article offered for sale by a merchant, wherein the image is steganographically encoded with plural-bit binary data;  
optically sensing the image to produce image data corresponding thereto;  
decoding the steganographically encoded data from the image data; and  
electronically ordering the article from the merchant by use of said decoded data, wherein said ordering makes use of earlier-stored customer profile information.*

*The Final rejection states, "Bloomberg teaches providing a printed catalog."*

Contrary to the Action, Bloomberg does not so teach. Bloomberg does not mention catalogs. A full text search of the patent finds no occurrence of the word "catalog."

The Final rejection further states "Bloomberg teaches providing a printed catalog that includes an image of an article offered for sale by a merchant."<sup>30</sup> Again, however, Bloomberg does not so teach. The reference appears to have no disclosure concerning any article offered for

<sup>29</sup> July 14, 2004, Final Rejection, page 4, line 12 (not counting blank lines).

<sup>30</sup> July 14, 2004, Final Rejection, page 4, lines 12-13.

clients, and the services merely use the codes and millions of "creative property" codes and reporting the results to the clients. CAP and BML have "lower tech" approaches to this waste service.

A large coordinated monitoring service using the principles of this invention would classify the creative property supplier clients into two basic categories, those that provide master codes themselves and will be able to remain secure and unpublished, and those that are in the public domain master codes (and probably the latter). The monitoring service would perform the same checks (checks) of publicly available information, including doing high level pattern checks with the use of super computers. Magazine ads and images would be scanned for analysis, video grabbed off of commercial channels would be digitized, audio would be sampled, and Internet sites randomly downloaded, etc. These master lists would then be fed into an ever-churning non-bona program which randomly looks for pattern matches against its large bank of public and private codes, master codes, material it is checking. A small sub-set, which might probably be a large set, will be flagged as note that a match occurred, and these will be fed into a more refined second system which begins to attempt to identify which of the materials are present and to perform a more detailed search on the flagged material. Presumably a search would then find out as flagged match material, owners of the material would be positively identified and a notification would be sent to the client so that they can verify that it is a legitimate sale of their material. The same type of analysis of the private monitoring service outlined above applies to this case as well. The monitoring service could also serve as a formal bully in cases of a found and proven infringement, sending out letters to infringing parties witnessing the infringement and seeking inflated royalties so that the infringer might avoid the more costly alternative of going to court.

The invention claimed is

1. A method of initiating access to a first computer process from a second computer process, said first and second computer processes being capable of operating upon data objects and content files, the method comprising:

creating a data object which contains particular information that can be used to initiate a particular action in said first computer process;

steganographically embedding said data object in a content file which can be operated upon by said second computer process;

operating upon said content file by said second computer process; and

said second computer process utilizing said particular information to initiate a link to said first computer process.

2. The method of claim 1 wherein the creating step includes the substep of including in the content file a human-perceptible indicium for indicating the presence of the steganographically embedded data object.

3. The method of claim 1 wherein the steganographically embedded data object includes a unique address.

4. The method of claim 1 wherein the steganographically embedded data object includes a unique number for use in accessing a data base in the first computer process.

5. A system for initiating access to a first computer process from a second computer process, said first and second computer processes being capable of operating upon data objects and content files, said system comprising:

a data object which contains particular information which can be used to initiate a particular action in said first computer process;

a content file accessible to said second computer process which has steganographically embedded therein said data object; and

means in said second computer process for operating upon said content file and for using said data object to initiate a link to said first computer process.

6. A system according to claim 5 in which the data object is distributable over a computer network that has sites with discrete addresses, the data object including:

user interface information presentable to a user at one of the network sites in audio or visual form; and

address information steganographically embedded in the content file, the address information being indicative of a discrete address of a site of one of said computer processes.

7. The system of claim 6 in which the data object further includes an icon presentable to a user at one of the network sites in audio or visual form, the icon being indicative of the presence of the steganographically embedded address information.

8. The system of claim 6 wherein the user interface information is graphic data visually presented to a user at one of the network sites.

9. A system according to claim 5 implemented as a computer network system that has a plurality of sites, each site having a discrete address, the system including means for distributing a hypertext document that comprises said data object and an attached header file, an improved hypertext document comprising a data object having address information embedded therein and improved user interface programs which automatically recognize the existence of the address information, and which automatically route users to that address after user instructions to do so.

10. A system according to claim 5 in which the data object includes function code defining a linking function;

the second computer process, including:

means for extracting the function code from the decoded data object; and

means for executing the linking function in accordance with the function code.

11. A system according to claim 10 in which the function code includes software operable on the second computer process to route the user to the address in the decoded data object.

12. A system according to claim 10 in which the first computer analyzes the data object to determine whether it recognizes and can execute the function code.

13. A method according to claim 11 in which the data file includes a hypertext document.

14. A system according to claim 5 in which the data object includes a URI, comprising an address and the first computer process includes means responsive to initiation of the link for sending a data file to the second computer process.

15. A system according to claim 5 in which the network includes a data communications medium by which the first and second computer processes are connected, each computer process on the network having a unique address.

16. A system according to claim 5 in which the data communications medium includes an Internet connection, and the first and second computer processes each have one said address which includes a domain name, the data object including the domain name of the first computer process.

17. A system according to claim 5 including means for imprinting the steganographically embedded data object in a visible image and means for inputting a data file defining the visible image as the content file into the first computer process.

BEST AVAILABLE COPY

**statistical multiplexer** *n.* A multiplexing device that adds intelligence to time-division multiplexing by using buffering (temporary storage) and a microprocessor to combine transmission streams into a single signal and to allocate available bandwidth dynamically. *Also called:* stat mux. *See also* dynamic allocation, multiplexing, time-division multiplexing.

**statistics** *n.* The branch of mathematics that deals with the relationships among groups of measurements and with the relevance of similarities and differences in those relationships. *See also* binomial distribution, Monte Carlo method, probability, regression analysis, standard deviation, stochastic.

**stat mux** *n.* *See* statistical multiplexer.

**status** *n.* The condition at a particular time of any of numerous elements of computing—a device, a communications channel, a network station, a program, a bit, or other element—used to report on or to control computer operations.

**status bar** *n.* In Windows 9x and Windows NT 4 and later, a space at the bottom of many program windows that contains a short text message about the current condition of the program. Some programs also display an explanation of the currently selected menu command in the status bar. *See the illustration.*

Page 2 Sec 1 2/46 At 4" Ln 19 Col 9

#### Status bar.

**status codes** *n.* Strings of digits or other characters that indicate the success or failure of some attempted action. Status codes were commonly used to report the results of early computer programs, but most software today uses words or graphics. Internet users, especially those with UNIX shell accounts, are likely to encounter status codes while using the Web or FTP. *See also* HTTP status codes.

**steganography** *n.* A "hide-in-plain-sight" technique for concealing information by embedding a message within an innocuous cover message. In steganography, bits of unnecessary data within an image, sound, text, or even a blank file are replaced with bits of invisible information. The term steganography comes from the Greek for "covered writing" and historically included any method of secret communication that conceals the existence of the message. Because steganography cannot be detected by decryption software, it is often used to replace or supplement encryption.

**step-frame** *n.* The process of capturing video image frame at a time. This process is used by computers too slow to capture analog video images in real time.

**stepper motor** *n.* A mechanical device that rotates fixed distance each time it receives an electrical pulse. A stepper motor is part of a disk drive.

**step-rate time** *n.* The time required to move a disk arm from one track to the next. *See also* actuator, stepper motor.

**stereogram** *n.* *See* autostereogram.

**sticky** *adj.* In reference to a Web site, properties of targeted content or services that increase the amount of time users choose to spend at the site and increase their desire to return to the site repeatedly.

**StickyKeys** *n.* An accessibility feature built into Macintosh and Windows computers that causes modifier keys such as Shift, Control, or Alt to "stay on" after they are pressed, eliminating the need to press multiple keys simultaneously. This feature facilitates the use of modifiers by users who are unable to hold down one key while pressing another.

**stochastic** *adj.* Based on random occurrences. For example, a stochastic model describes a system by taking account of chance events as well as planned events.

**stop bit** *n.* In asynchronous transmission, a bit that signals the end of a character. In early electromechanical teleprinters, the stop bit provided time for the receiver mechanism to coast back to the idle position and, depending on the mechanism, had a duration of 1.5 to 2 data bits. *See also* asynchronous transmission, C parity, parity bit, start bit.

**Stop error** *n.* A serious error that affects the operating system and that could place data at risk. The operating system generates an obvious message, a screen with Stop error, rather than continuing on and possibly corrupting data. *Also called:* blue screen error, fatal system error. *See also* Blue Screen of Death.

**storage** *n.* In computing, any device in or on which information can be kept. Microcomputers have two main types of storage: random access memory (RAM) and disk and other external storage media. Other types include read-only memory (ROM) and buffers.

**storage area network** *n.* A high-speed network that provides a direct connection between servers and storage devices, including shared storage, clusters, and disaster-recovery systems.

**Loss management system for commuter ticket issue appts - incorporates  
registration unit to register lost object data input with input  
part into memory unit of host computer**

Patent Assignee: TOSHIBA KK (TOKE )

Number of Countries: 001 Number of Patents: 001

Patent Family:

Patent No	Kind	Date	Applicat No	Kind	Date	Week
JP 7160769	A	19950623	JP 93308999	A	19931209	199534 B

Priority Applications (No Type Date): JP 93308999 A 19931209

Patent Details:

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
JP 7160769	A	8	G06F-017/60	

Abstract (Basic): JP 7160769 A

The loss management system consists of two or more **connections** of commuter ticket issue appts to a host computer through a communication line. The host computer consists of a memory unit which stores the lost **object data**.

A reference unit searches the lost object from the lost **object data** stored in the memory unit. An **input** part of the commuter ticket issue appts **inputs** the lost **object data**. A registration unit registers the lost **object data input** with the **input** part into the memory unit of the host computer.

**ADVANTAGE** - Provides very efficient loss object management system. Avoids need for asking many stations repeatedly. Provides lost object management which manages lost object collectively.

## ABSTRACT

PURPOSE: To efficiently manage information of an object of art by classifying and encoding a feature of the information of an object of art.

CONSTITUTION: An art object key item 17 is an item which is set in **order** to execute a united classification to each data, the kind of a work of art, the year and month of manufacture, a **reading** KANA (Japanese syllabary) of the name of a work of art, etc., are encoded. A **manufacturer** information outline 18 is an item group having an item of the same format as a primary key of a record of a **manufacturer** data base 15 in the head, an outline of **manufacturer** information is stored therein, and other item 19 is a detailed information group of an object of art containing a sentence item. An operator **inputs** data by an interactive format from a screen with regard to these three item groups, and as for the **manufacturer** information outline 18, by **inputting** only a **manufacturer** primary key, an execution key is depressed, and thereafter, a **manufacturer** data base is **accessed** as a function of a registration updating part 4. Subsequently, by referring to both the **manufacturer** primary keys and extracting the record of the **manufacturer** data base, a record of an art **object** data base is copied. In such a way, information of an object of art can be managed efficiently.

## ABSTRACT

PURPOSE: To attain ease of addition of a troubleshooting function by designing the titled device so that a ladder diagram file, a mnemonic file in a host computer and an **object data** file in a low- **order** computer are converted in forward/ backward way one another.

CONSTITUTION: A ladder diagram keyed in from a keyboard 6a by the operator is stored once as a ladder diagram data file A, converted in forward/backward way to a mnemonic code, stored in a mnemonic data file B, transferred to a low- **order** computer 3, converted in forward/backward way into an object code and stored in an **object data** file C. The data is loaded down to a simulator 4 and outputted on an **input** /output device 5. Since the object code is delivered to many **customers** by the **input** /output device such as a cassette tape incorporated in the system, correction/edition of a sequence program are attained easily.

 Based on patent WO 9004290

Abstract (Basic): WO 9004290 A

The system uses a normal three-part coding scheme in which data bits are given transitions of one polarity and clock pulses are transitions of the opposite polarity. The nature of the bits is given by the timing of the transitions with relation to the clock transitions. The apparatus detects the positions of the clock transitions and from these the data-transition positions and hence the encoded data.

The indication of which polarity is which is given by an alignment mark waveform, which consists of a series of pulses with equally spaced positive and negative transitions, which could not be data because it is illegal for data transitions to occur at the midpoint. They may be in first or second half to give a bit value. After the alignment mark waveform there is a long apause with the signal in the polarity corresponding to after clock. This defines polarity as the first transition is a data bit.

USE/ADVANTAGE - E.g. in data recording. Polarity easily defined.

----------	---	--	--	-------------	-------------------

Abstract (Basic): EP 279505 A

Method and appts. for forming markings on a moving web (10), involves directing a marking light beam (32) against the web (10), pref. a laser beam, via a stencil (84) and a focussing lens (90). The beam (32) is optically switched (70,78) to follow different paths, pref. by a system of rotating mirrors (71a).

Specifically the markings are repeatedly made at locations spaced across the web, e.g. of a web for slitting into strips and then into sheets each with a marking.

Pref. the mirrors (71a) and stencils (84) are on a common rotor (60).

ADVANTAGE - **Manufacturers** marks on paper sheets are made more easily than by **water - marking** processes.

## Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
BE 901232	A		23		

Abstract (Basic): BE 901232 A

The mobile stations are **linked** by FSK radio to several base stations **connected** to a concentrator station and a **digital** telecommunication **exchange**, where the demodulator includes a noise filter for the sampling signals transmitted by the base stations. Supplementary sampling signals are derived by an oversampling circuit. Changes in polarity of both original and supplementary sampling signals are detected by a zero-crossing detector and a decision circuit which **recognises** the two transmission frequencies.

A transmission rate synchroniser also uses finite-state-machine software, to generate a validation signal synchronised with the oversampling. This opens or closes the transmission gate.

ADVANTAGE - Uses minimal supplementary equipment for quick and easy restitution of the binary gate generated at the mobile stations.

Treatment: Practical (P)

Abstract: The decision support processing is essential in multimedia databases since it reveals valuable information from tremendous **hidden data**. In decision support environments, most transactions have long-term **read** operations **accessing** significant portions of database. In this **sense**, the traditional concurrency control schemes that are tuned to **online transaction** processing (OLTP) are not suitable for decision supporting environments since long transactions may cause serious locking overhead. In this paper, a locking-based concurrency control scheme is presented for decision support environments in multimedia databases. In this work, transactions are classified into two groups, the typical OLTP transaction and query transaction that is composed of **read** operation for decision support. Assuming that query transactions **read** considerable portions of whole database, the proposed scheme incurs less locking overhead than the existing scheme called explicit locking. This paper also proves that the proposed scheme performs better than the existing scheme.

Abstract: There has been much research on digital **watermarking** technology or fingerprinting vigorously to safeguard protective rights for knowledge and poverty for digital contents. DRM (Digital Rights Management) is not only protective rights for knowledge and poverty, but also management and systems that are necessary to put out, circulate and use for contents. This technology, DRM, encrypts contents to protect digital contents and they are sold users on. Sellers transmit contents with 'usage right' and a license including a key of encryption. The key of encryption **decodes** encoded files. The right of usage restricts users' application of contents. Even if digital contents that are applied the DRM are copied illegally and circulated, contents will be protected from that because a player of DRM checks the existence of licenses and allows contents to be restored. However, this method might cause users to feel inconvenient since the users can only restore contents through the licenses offered by a player or a Smartcard. If radio as well as cable is used popularly in the future, there will be a lot of limits to use those kinds of players. The method need different players in **order** to work successfully in wired and wireless environments. In the case of using Smartcards, there might be a dangerous situation when the Smartcards disappear. We propose two kinds of ideas. One is protecting contents from illegal acts such as illegal copies when the contents are in the process of circulation. The other is the protocol that can give users convenience. Hidden agents are used so that contents are protected from illegal copies and illegal use in the contents and cuts off those illegal acts. The agent will be installed without any special setup. In addition, it can replace roles of **watermarking** as a protection. We show the solution of illegal copies that happen frequently.

Abstract: The efficacy of various copyright management systems depends largely on keeping the "security" out of view from consumers while enabling clear responsibility to be attributed to the content being traded. Consumers have clearly rejected **access** restriction and registration protocols as currently deployed. The general failure of such systems is best represented by the widespread acceptance of Napster and the difficulty with implementations of digital rights management (DRM) systems on consumer PCs. Further, ignoring the historical notion of "fair use" and the "first sale doctrine" serves to obscure the value attributed to content. Success in commercializing the exchange of media content must focus on value in the media; the file format must be relegated to convenience. The presence of a content identification **watermark** is the hook to facilitate a number of potential markets surrounding the use of music, and other media, by consumers. We lay out how several of the **decoding** systems work, and why **watermarks** are a necessary feature of any workable market for the commercial exchange of content.

Abstract: Digital **watermarking** is well known as enabling technology to prove ownership on copyrighted material, detect originators of illegally made copies, monitor the usage of the copyrighted multimedia data and analyze the spread spectrum of the data over networks and servers. Research has shown that data hiding techniques can be applied successfully to other application areas like manipulation **recognition**. We show our innovative approach for integrating **watermark** and cryptography based methods within a framework of new application scenarios spanning a wide range from dedicated and user specific services, "Try&Buy" mechanisms, to general means for long-term customer relationships. The tremendous recent efforts to develop and deploy ubiquitous mobile communication possibilities are changing the demands but also the possibilities for establishing new business and commerce relationships. Especially we motivate annotation **watermarks** and aspects of M-commerce (mobile commerce) to show important scenarios for **access** control. Based on a description of the challenges of the application domain and our latest work, we discuss which methods can be used for establishing services in a fast, convenient and secure way for conditional **access** services based on digital **watermarking** combined with cryptographic techniques. We introduce an example scenario for digital audio and an overview of steps in **order** to establish these concepts practically. (27 Refs)

Treatment: Theoretical (T); Experimental (X)

Abstract: Previously, a capacitively coupled Josephson memory cell was proposed in which an rf-SQUID device couples capacitively with a single junction. **Binary data** stored in an rf-SQUID device can be **read** through a flux change which generates a pulse signal to be detected. The pulse has a very narrow width, i. e., an **order** of picoseconds. By assuming the **read** mode of a capacitively coupled memory cell, the response of a single junction has been studied for a very narrow-width pulse current which varies with fluxons. The minimum pulsewidth and amplitude required to switch a junction and a bias current dependence before and after the pulse is applied are calculated analytically. The relation between a minimum pulsewidth and amplitude and a switching time for a **sense** junction, which cannot be solved analytically, is calculated by computer simulation. The influence of a sinusoidal current superimposed over a bias current is also studied by computer simulation. (18 Refs)

**Title: Digital ultrasonic image construction using electronic ordered dither techniques**

Author(s): Blake, R.A.; Allebach, J.P.

Author Affiliation: Center for Composite Materials, Univ. of Delaware, Newark, DE, USA

Journal: Journal of Nondestructive Evaluation vol.2, no.1 p.75-84

Publication Date: March 1981 Country of Publication: USA

CODEN: JNOED5 ISSN: 0195-9298

Language: English Document Type: Journal Paper (JP)

Treatment: Applications (A); Practical (P)

Abstract: The use of a digital microprocessor based system for the acquisition of ultrasonic C- **scan** information is investigated. The C- **scan** information is displayed on a **binary display** device using **electronic ordered** dither techniques to represent gray levels. The digital system with a **binary display** increases system flexibility and yields better reproducibility and constant image quality independent of the display medium. Images may be stored on magnetic tape or disk for later retrieval and image processing. The techniques which are described allow for image magnification and a reduction in **scan** time by replacing the mechanical **linkage** between the **scanner** and the display with digital signals. A detailed comparison is made between two dither signals, and the advantages of each are discussed. (10 Refs)

...TEXT: MANAGEMENT

Advanced transaction management is concerned with database support for applications that demand consistent database **access** beyond the traditional scope. Traditional data processing in business applications is known as **on - line transaction** processing (OLTP). Relatively simple operations such as querying and updating of huge amounts of small records are performed. CIM applications such as engineering design and production control have different **access** patterns and thus need advanced transaction management concepts, such as semantics based concurrency control, co...

...are much longer than in traditional data processing. A single engineer

may check out a **design object** from a public database into his private database and may work on it for days...

...concurrent transactions to yield the same results as if they were executed serially in some **order**. Durability guarantees to preserve the effects of committed transactions after recovery from system failure or...

...complete rollback in case of a memory failure is inadequate. Consistency checking using the no- **read** -write conflict paradigm has to be extended to semantics based concurrency control[32]. The conventional approach to the problem of concurrency control is based on the synchronization of database **reads** and writes. The concurrent execution of transactions is allowed (consistent and isolated) if they have...

...concepts relax this requirement using knowledge about the application domain, the application process, and the **access** patterns of the users that concurrently use the database. Nonserializable transactions thus allow the interleaving...
